AGENDA
Utility Commission Regular Meeting
Monday, June 23, 2025
5:30 PM
Conference Room, City Hall

1. **CALL TO ORDER**
2. **ADDITIONS OR CORRECTIONS TO AGENDA**
3. **AUDIENCE INPUT**
4. **APPROVAL OF MINUTES**
   a. March 31, 2025, Utility Commission Meeting Minutes
5. **PUBLIC HEARINGS**
6. **OLD BUSINESS**
   a. Water Efficiency Rebate Update
   b. Manganese Monitoring Update
7. **NEW BUSINESS**
   a. 2024 Rosemount Surface Water Quality Monitoring Program Report
8. **EXECUTIVE DIRECTOR'S REPORT**
   a. Well Pumping Report
   b. Action Item / Issues list
   c. Set Next Meeting Agenda – September 22, 2025
9. **ADJOURNMENT**

CALL TO ORDER
Pursuant to due call and notice thereof, a regular meeting of the Utility Commission was held on Monday, March 31, 2025, at 5:30 PM in Rosemount Public Works & Police, EOC Room, 14041 Biscayne Ave.

Chairperson Johnson called the meeting to order with Commissioners Miller and Demuth.

Staff present included the following: City Administrator Martin, Public Works Director Egger, and Recording Secretary Simonson.

ADDITIONS OR CORRECTIONS TO AGENDA
None.

AUDIENCE INPUT
None.

APPROVAL OF MINUTES
4.a. November 24, 2024, Utility Commission Meeting Minutes

Motion by Demuth, **Second by** Miller
Motion to approve the November 24, 2024, Utility Commission Meeting Minutes
Ayes: 3.
Nays: None. Motion Carried.

PRESENTATION
None.

OLD BUSINESS
6.a. Manganese Monitoring Update
Director Egger stated that staff continue quarterly sampling, though access is limited to 60–70% of sites due to winterized outdoor faucets. Q1 and Q2 2025 results will be presented at the June meeting.

NEW BUSINESS
7.a. Set Meeting Dates for 2025-2026

Motion by Demuth; **Second by** Miller
Motion to set the 2025-2026 Utility Commission meeting dates per attached calendar.
Ayes: 3.
Nays: None. Motion Carried.

Commissioner Miller noted she is not available for the June 23, 2025, Utility Commission meeting.

EXECUTIVE DIRECTOR'S REPORT
8.a. 2024 Well Pumping Report & 2025 Well Pumping Record through February
The total amount of water pumped from wells in 2024 is 10% lower than in 2023. The decrease in water usage is likely due to the abundant precipitation received in the spring.

Director Egger noted that with the new well 17, a new appropriation permit will be required. That process will take place after the well is built to determine capacity.

Commissioners asked about potential upgrades to the splash pad, specifically the addition of a chlorinated recirculation system. Staff responded that the Parks & Recreation Department is currently in the planning phase of a Central Park redesign. A recirculation system for the splash pad will be included in the scope and budgeting process but will require City Council approval.

8.b. 2024 City Water Usage with 10-Year Trend Chart

Director Egger noted that government water usage in 2024 was below 38 million gallons—the lowest amount recorded in the past 5 years.

It was also noted that there is currently insufficient data to assess water usage at the Public Works & Police Building. Several years of data will be needed to establish a reliable estimate of its annual consumption.

8.c. Top 10 Water Users 2024

Staff pointed out that there are no changes to the top 10 water users in the city for 2024. Some of these top users include multifamily residential properties, not just industrial or commercial accounts.

When current residential rates were applied to the usage levels of the top 10 users, billing amounts increased slightly. This analysis may help inform future utility rate modeling for 2026. Commissioners requested further evaluation of how residential water rates impact high-, mid-, and low-volume commercial and industrial users.

Commissioners also inquired about the 2021 tier 4 rates, noting that rate changes appeared to have occurred in some areas but not others. Staff will review the 2021 meeting minutes and rate models for clarification.

8.d. Well 17 Update

Drilling mobilization for Well 17 began last week. The contractor is currently drilling the pilot hole and collecting geological samples. Once this phase is complete, full-width boring of the well will begin. Staff plan to schedule a site visit for commissioners later in the process.

A separate contract for the well house structure has been awarded, but construction will not begin until drilling is complete. Well 17 is expected to be operational by summer 2026.

8.e. Action Item / Issues list

i. Presentation by Dan Schultz of the Parks & Rec Department on the Central Park renovation at a future commission meeting.
ii. Confirm deadline of 3/28/2025 for the Met Council Equity-Focused Water Efficiency Grant Pilot Program.

8.f. Set Next Meeting Agenda – June 23, 2025

i. Update on Water Efficiency Grant Program
ii. Water Quality Pond Monitoring Report

iii. Manganese sampling update
iv. Review of 2024 Consumer Confidence Report

ADJOURNMENT

There being no further business to come before the Utility Commission at the regular meeting and upon a motion by Demuth and a second by Miller, the meeting was adjourned at 6:32 p.m.

Respectfully submitted,

Amy Simonson
Public Works Office Specialist

EXECUTIVE SUMMARY

Utility Commission Regular Meeting: June 23, 2025

AGENDA ITEM:	Water Efficiency Rebate Update	**AGENDA SECTION:**	OLD BUSINESS
PREPARED BY:	Amy Simonson, Public Works Office Specialist	**AGENDA NO.**	6.a.
ATTACHMENTS:	2025.06.23 Water Efficiency and Stormwater Rebate Update	**APPROVED BY:**	
RECOMMENDED ACTION: Informational Only			

BACKGROUND

Summary and updates on the Water Efficiency Rebate and Stormwater Rebate program activity up to June 13, 2025. The current grant program is 2024-2026.

RECOMMENDATION

None

Quarterly Water Efficiency Rebate Update:

The City of Rosemount was awarded a Water Efficiency Grant from the Metropolitan Council (MCES) in the amount of $27,000 for the 2024-26 grant cycle.

As part of this program, the following rebate amounts are allowed:

- $50 for Water Sense Toilets
- $150 for Energy Star Washers
- $150 for Energy Star Dishwashers
- $150 for Water Sense Irrigation Controllers
- $200 for Irrigation system audits

The Vermillion River Joint Powers Organization (VRWJPO) ended its program partnering with cities in the county to provide funding for multi-family residential properties for low-cost irrigation audits and improvement cost share grants. The City Council approved the Irrigation Efficiency Grant Program as a replacement at its August 20, 2024, meeting. The City is working on reaching out to HOAs and has received some interest in the updated program.

Table 1 provides a summary of the entire rebate program activity through Q1 2025.

Table 1	2020	2021	2022	2023	2024	2025
Gallons of Water Saved Annually (est.)	386,800	200,200	*1,665,936	687,136	31,600	73,800
Total Rebate	$4,971.67	$3,790.26	$20,436.74	$11,391.48	$1,300	$2,850.00
Municipality Contribution (25%)	$1,242.92	$911.15	$10,902.94	$2,922.87	$325	$712.50
Irrigation Controllers Replaced:	35	1	18	13	0	0
Toilets Replaced:	6	1	7	11	2	6
Clothes Washers Replaced:	8	1	5	8	6	9
Dishwashers Replaced	0	0	0	3	2	6
Audits (Residential):	1	0	0	0	0	0
Commercial Audit In a partnership with the Vermillion River Watershed Joint Powers Organization (VRWJPO) on their Urban Water Conservation Program. 2021 Municipality Contribution partially provided by Stormwater Utility.	6			2	0	0

*Includes commercial audit annual water savings
**Table data is annual and not by grant period

Quarterly Stormwater Rebate Update:

In May 2019, the Utility Commission recommended City Council adopt a rebate program for residents

to install projects on their property to improve stormwater quality and reduce runoff volume. In March 2020, City Council approved the Stormwater Rebate Policy and established a maximum amount of $5,000.

Table 2 provides a summary of the entire rebate program activity.
Number of BMPs installed for each category in (parentheses) following dollar amount listed

Here is a summary of advertisements of the program in 2025:

- News & Highlights Post https://www.rosemountmn.gov/
- The City Newsletter
- Information at Home & Business Expo in March
- Included in course materials for Landscaping for Clean Water Workshops
- Individual staff contacts with residents
- Monthly social media posts
- 1st quarter utility insert

Staff will continue to publicize these programs via social media, city newsletters, staff updates and additional methods.

EXECUTIVE SUMMARY

Utility Commission Regular Meeting: June 23, 2025

AGENDA ITEM:	Manganese Monitoring Update	**AGENDA SECTION:** OLD BUSINESS
PREPARED BY:	Nick Egger, Public Works Director	**AGENDA NO.** 6.b.
ATTACHMENTS:	Manganese Sampling Locations Map, Manganese Sample Results Summary Q1 & Q2 2025, Manganese Sample Results Chart MVTL Measurements Q1 & Q2 2025, Well Pumping Contributions - Manganese Sampling Dates Q1 & Q2 2025, MVTL Sample Results Report - Q1 2025 (Combined), MVTL Sample Results Report - Q2 2025	**APPROVED BY:** NAE
RECOMMENDED ACTION: Informational only		

BACKGROUND

Staff continued to collect quarterly tap water samples from several dozen locations throughout the City over winter quarter (February/March) and earlier this spring (early May). Samples were collected from as many properties as were available on account of access to a running tap at the property (winter conditions) and as staff had availability to make the rounds, so although most properties were sampled, there were some for which a sample was not collected.

As with previous rounds of sampling, the City measured manganese concentrations for all samples and also sent companion samples to Minnesota Valley Testing Lab (MVTL) for independent third-party analysis.

- For the Commissioners' information, the following materials have been included:A summary table of all results from the February/March (Q1 2025) and May (Q2 2025) sampling periods, showing manganese concentration data from both the City (orange) and MVTL (blue) analyses
- A chart plotting the MVTL analysis results for both Q1 and Q2 samples
- Tables detailing the pumping contributions from each well on the sample collection days
- The sample results reports from MVTL for Q1 & Q2

Staff will continue to conduct an additional one to two quarterly rounds of samples to get a complete annual cycle's worth of data, which will then be taken in totality as a basis for discussion and consideration of next steps by the City.

Certificate of Analysis

Approval

All data reported has been reviewed and approved by:

Dave Smahel, Chemistry Production Director New Ulm, MN

Analyses performed under Minnesota Department of Health Accreditation conforms to the current TNI standards.

NEW ULM LAB CERTIFICATIONS:
MN LAB # 027-015-125 ND WW/DW # R-040

BISMARCK LAB CERTIFICATIONS:
MN LAB # 038-999-267 ND W/DW # ND-016 SD SDWA

Workorder Comments

All analytes with dilution factors greater than 1 (displayed in DF column) required dilution due to matrix or high concentration of target analyte unless otherwise noted and reporting limits (RDL column) have been adjusted accordingly.

MVTL guarantees the accuracy of the analysis done on the sample submitted for testing. It is not possible for MVTL to guarantee that a test result obtained on a particular sample will be the same on any other sample unless all conditions affecting the sample are the same, including sampling by MVTL. As a mutual protection to clients, the public and ourselves, all reports are submitted as the confidential property of clients, and authorization for publication of statements, conclusions or extracts from or regarding our reports is reserved pending our written approval.

Enclosed are your containers for your sampling event. Completely fill and label containers appropriately for the analyses to be conducted. Complete chain of custody and submit with samples. For questions regarding individual parameter holding times, chemical and thermal preservation and sample volumes please refer to our sample preservation guide on our website at www.mvtl.com or by contacting customer service at 1-800-782-3557. If samples show signs of contamination, inadequate preservation or are in any way compromised you will be contacted as to whether to proceed with analysis or submit a new sample.

Please submit the top copy with your samples. We will return the completed original with your results.

MVTL guarantees the accuracy of the analysis done on the sample submitted for testing. It is not possible for MVTL to guarantee that a test result obtained on a particular sample will be the same on any other sample unless all conditions affecting the sample are the same, including sampling by MVTL. As a mutual protection to clients, the public and ourselves, all reports are submitted as the confidential property of clients, and authorization for publication of statements, conclusions or extracts from or regarding our reports is reserved pending our written approval.

ROSEMOUNT
MINNESOTA

EXECUTIVE SUMMARY

Utility Commission Regular Meeting: June 23, 2025

AGENDA ITEM:	2024 Rosemount Surface Water Quality Monitoring Program Report	**AGENDA SECTION:**	NEW BUSINESS
PREPARED BY:	Jane Byron, Stormwater Specialist	**AGENDA NO.**	7.a.
ATTACHMENTS:	2024 Rosemount Surface Water Monitoring Report	**APPROVED BY:**	NE
RECOMMENDED ACTION: Discussion			

BACKGROUND

The City of Rosemount (City) has been monitoring water quality and water levels in select ponds since 2009 to provide the city with data it uses to help guide stormwater water management activities. The City has monitored the following ponds for the last several years, including in 2024:

Monitoring Location	Drainage Area Information			Monitoring Activities		
	Basin Surface Area	Drainage Area	Percent (%) Impervious	Water Level	Apr-Oct Water Quality	Snow-melt Sampling
Location 1 – Marcotte 1408	1.90	27.4	17%	X	X	X
Location 2 – Glendalough 1486	1.39	142.8	25%	X	X	
Location 3 – Trailer Park 1589	0.87	37.2	37%	X	X	
Location 4 – Unnamed 1687	0.55	58.8	25%	X	X	
Location 5 – Cat 1716	0.55	169.2	30%	X	X	X
Location 6 – Erickson 578	2.26	166.2	39%	X	X	X
Location 7 – Bloomfield 1864	0.79	37.3	35%	X	X	X
Location 8 – O'Leary's 600	5.56	125.5	43%	X	X	
Location 9 – Wachter 2443	5.1	384.8	41%	X	X	X
Location 10 – Shannon 614	3.17	176.8	36%	X	X	
Location 11 – Greystone 0232[1]	0.58	25.1	45%	X		
Birger Pond						X

Basins are monitored for total suspended solids (TSS), total phosphorus (TP), ortho-phosphate (OP), chloride, and nitrogen (new in 2022). Water levels are used to evaluate level fluctuations, runoff volumes, and infiltration rates.

Here are some key takeaways from the report:

- Water level monitoring shows Wachter Pond is consistently exceeding its management elevation

by several feet, and Shannon Pond has had an increasing trend over the last 10 years and frequently exceeds its management elevation.

- Water levels at Bloomfield Pond, Shannon Pond, and Wachter Pond have remained stable and not dropped despite four years of drought.
- Basins with higher estimated runoff volumes have tended to be those with higher impervious surface coverage or that receive large amounts of flow from upstream basins.
- Estimated city-wide infiltration rates have exceeded the estimated infiltration rate from the 2009 Non-Degradation Report, but have shown a decreasing trend until 2023 and 2024.
- The city-wide long-term median TSS shows overall effective treatment in monitored basins.
- The city-wide long-term median TP is within the anticipated range for treated stormwater.
- OP on average has been 18 percent of the TP that was observed, which is much lower than the expected range when the source is plant litter and lawns.
- There has been an increasing trend in chloride concentrations since 2014.
- Select city ponds have periodically exceeded the chronic or acute chloride standard; Erickson Pond was the only pond to exceed the chloride chronic standard in 2024.
- Nitrate concentrations are well below the proposed chronic nitrate standard for Class 2B waters.

It should be noted, growing season monitoring for Birger Pond in Innisfree Park is not contained in this report. Birger Pond is monitored by a citizen volunteer as part of the MetCouncil Community-Assisted Monitoring Program (CAMP).

RECOMMENDATION

Discuss the 2024 Surface Water Quality Monitoring Program Report.

TABLE OF CONTENTS

ATTACHMENTS

1. EXECUTIVE SUMMARY

The City of Rosemount (City) has implemented a water quality monitoring program since 2009 that provides the city with empirical data that can be used to help guide stormwater water management activities. The City has monitored between 10-12 basins annually for water quality parameters including total suspended solids (TSS), total phosphorus (TP), orthophosphate (OP), chloride, and nitrogen (new in 2022). Water levels are also monitored to evaluate level fluctuation, runoff volumes, and infiltration rates. This report provides a summary of the results of data collection activities from 2014-2024.

The monitoring data is used to fulfill multiple MS4 program requirements in minimum control measures (MCMs) 5 and 6 related to inspection, long-term operation, and maintenance of infiltration Best Management Practices (BMPs). The water level data is used to observe fluctuations in basin levels, especially landlocked basins, to protect adjacent structures from flooding risks. Observed infiltration rates were compared to infiltration results outlined in the City's Non-Degradation Report. Runoff ratios for the individual basins are calculated using localized rainfall data and level data and were evaluated against impervious surface percentages and land use types.

Water quality is utilized to determine if basins are meeting anticipated pollutant removal efficiencies for total suspended solids and total phosphorus. Additionally, snowmelt sampling is conducted to assess winter pollutant concentrations associated with snowmelt runoff.

Data collection activities were conducted from May through October each year, with snowmelt sampling occurring during the winter. Basins that are monitored for level are equipped with an electronic monitoring device that records continuously. Event-based rainfall is also monitored at several locations within the City to provide localized rainfall totals. Water quality samples are collected as grab samples monthly.

A summary of the notable findings from the monitoring activities include:

Water Level Monitoring

- Landlocked basins Location 9 (Watcher) and Location 10 (Shannon) have shown a significant increasing trend in minimum, maximum, and average water levels in past years monitoring, but saw lower levels starting in 2021 and continuing through 2023. That trend was reversed in 2024, with the minimum, maximum, and average water levels increasing at both locations. Management activities at those sites should be evaluated to ensure adequate storage capacity and acceptable water levels at those sites.
- The long-term City-wide Rainfall to Runoff (R/R) ratio was 0.21, which indicates that, on average 21 percent of rainfall ends up as runoff within the city.
- Infiltration monitoring has shown a 9-year average infiltration rate of 0.063 inches per hour (in/hr) City-wide. The 2024 infiltration rate of 0.095 in/hr was above the 9-year average.

Water Quality Monitoring

2024 monitoring season saw low amounts of rain and similar concentrations of pollutants at all locations, except for chlorides, which was higher at all locations.

TSS

- The long-term median concentration for TSS City-wide was 12 milligrams per liter (mg/L). The long term median TSS concentration ranged from 6 mg/L at Location 1 (Marcotte) to 34 mg/L at Location 10.

TP

- The long-term median TP City wide was 0.14 mg/L which is lower than the anticipated range for treated stormwater of 0.15 to 0.2 mg/L.

OP

- OP was noticeably greater at Location 6 than the other monitored basins, with a long-term median 0.091 mg/L. The next highest is Location 3 (Trailer Park Pond) with a long-term median of 0.050 mg/L. The drainage area to that basin includes a large area of open park space as well as drainage from a splashpad.

Chloride

- 2024 snowmelt sampling saw only Location 6 to exceed the 4-day chronic chloride standard (230 mg/L). In 2023, Location 6 snow melt sampling exceeded the maximum standard of 860 mg/L
- No other locations exceeded the 4-day chronic standard in 2024.
- Locations 6 and 9 contain areas of commercial and/or downtown land uses within their drainage areas, which is typically associated with higher salt use in the winter. This is reflected in the elevated chloride concentrations observed within the basins.

Nitrate

- Nitrate monitoring was new for 2022.
- Nitrate levels were very low throughout 2024.
- The highest nitrate concentration was 0.244 mg/L at Location 9 in February. The MPCA proposed chronic nitrate concentrations for Class 2B waters are 8 mg/L.

2. INTRODUCTION

The water quality monitoring program for the City of Rosemount (City) includes seasonal water data collection at select stormwater basins in the City. The data is used to fulfill multiple MS4 program requirements in minimum control measures (MCMs) 5 and 6 related to inspection, long-term operation, and maintenance of infiltration Best Management Practices (BMPs). The water quality monitoring program provides the City with empirical data that can be used for the following purposes:

- Guide Watershed and City Stormwater Plan Updates and discussions with observed runoff volumes and infiltration and evaporation rates.
- Identify potential areas to receive regional volume reduction credit through stormwater reuse applications.
- Validate pond treatment efficiencies from the SWAMP program with sampled Total Suspended Solids and Total Phosphorus concentrations.
- Supporting conclusions in the City's Non-Degradation Study with observed infiltration and evaporation data.
- Creating a baseline for discharge volumes and pollutant loading assumptions of possible future Total Maximum Daily Loads (TMDLs) in the Vermillion River and Mississippi River.
- Assessing winter pollutant concentration associated with snowmelt runoff.

Water level and water quality data were collected as part of this monitoring program to analyze basin performance and watershed characteristics. Water level and precipitation data was used to calculate runoff volumes for various storm events and to develop a relationship between rainfall and runoff for the drainage area. Water level data is utilized to generate infiltration and evaporation rates during periods of no rainfall. To evaluate these parameters, electronic monitoring equipment was used to continuously measure system water levels and rainfall amounts. The ponds selected for monitoring are summarized in **Table 2.1** below which also includes a description of basin and drainage area characteristics. In **Table 2.1**, Birger Pond was only monitored for snowmelt samples and has had water quality data collected by the Citizen-Assisted Monitoring Program (CAMP). The pond location maps are provided in **Attachment A** and include the drainage area and land use information.

Table 2.1: Pond Monitoring Locations

Monitoring Location	Drainage Area Information			Monitoring Activities		
	Basin Surface Area	Drainage Area	Percent (%) Impervious	Water Level	Apr-Oct Water Quality	Snow-melt Sampling

3. PROCEDURES AND METHODOLOGY

This section outlines the procedures and methods followed to perform monitoring and data analysis.

3.1. Water Level Monitoring

Pond level monitoring was completed using automatic level loggers that record water surface elevation at an interval of one reading per hour. During equipment installation at the beginning of each monitoring season, a reference elevation is collected to convert monitored water depth into water surface elevation. Monthly data retrievals and equipment maintenance are completed in conjunction with water quality sampling activities.

Image 3.1: Level Monitoring Configuration

The water level data is utilized to calculate rainfall to runoff (R/R) ratio for each rainfall event. A R/R ratio represents the proportion of rainfall that is not infiltrated or evaporated and thus ends up as runoff. The purpose of calculating an R/R ratio is to establish a relationship that can be used to estimate runoff for a drainage area. The data can be used to calibrate stormwater models, compare runoff produced by different drainage areas, and to analyze changes in runoff volume over time for a specific basin. A R/R ratio is calculated by estimating the volume received by the basin from the change in water level over the pond surface area. The volume is then converted to inches of runoff per acre of contributing watershed area. The annually calculated R/R ratio is the linear regression of the event-based R/R calculations for each year.

The water level data is also utilized to calculate infiltration and evaporation rates for the monitored basins. This data can be used to calculate actual volume infiltrated, and the trend data can be used to help identify basins in need of maintenance. The infiltration rates are calculated by change in water level over time, when water levels are below outlet elevations (basin is not discharging). The rates that are calculated include infiltration and evaporation.

3.2. Water Quality Sampling

Water quality samples were collected as grab samples from Locations 1-10 monthly, approximately May through October of 2024. Winter snow melt sampling was also completed at basins 1, 5, 6, 7, 9, and Birger Pond. The samples were targeted for the mid-water column, to be representative of concentrations within the basin. Snow-melt sampling followed the general procedures outlined in the MPCA Guidance (MPCA, 2020). The samples were collected using an extension rod sampler which was rinsed three times before collection. The samples were then transferred into laboratory provided containers with the appropriate preservative, placed in a cooler on ice, and delivered to Tri-City Laboratory in Bloomington, MN. The samples were analyzed for the parameters listed in **Table 3.1** below. CAMP data collected on Birger Pond was collected by volunteers at two-week intervals from April through mid-october. Water Quality samples were collected over the deepest spot on Birger Pond, along with temperature and Secchi disk measurements.

4. RESULTS

4.1. Water Level Monitoring

Stormwater runoff from areas within the City of Rosemount is directed to various lakes, ponds, or depressions within the city, many of which are landlocked. Location 6, Location 7, Location 9, and Location 10 are basins that are closely monitored because in addition to localized runoff, these basins also receive discharge from upstream stormwater features, which makes them susceptible to significant water level increases during major events. The City has outlined specific management elevations and activities at these sites to ensure adequate capacity is maintained to effectively store and treat stormwater runoff.

Image 4.1: Water Level Monitoring (Location 6)

The water level data that has been collected was evaluated against the management elevations that were established for each of the basins. 2024 water level charts with hourly rainfall data are included in **Attachment B**. **Table 4.1** below includes a summary of the minimum and maximum water elevations that have been observed over the 2024 monitoring season at each site, as well as applicable management elevations and outlet details.

Table 4.1: Water Level Summary

Basin Details					2024 Maximum and Minimum Levels			
Pond #	Basin ID	NWL	HWL	Outlet Details	Minimum Water Elevation (ft amsl))	Date	Maximum Water Elevation (ft amsl)	Date
Loc #1	1408	905.5	910.67	Lift -E	907.62	6/1/24	909.45	6/23/24

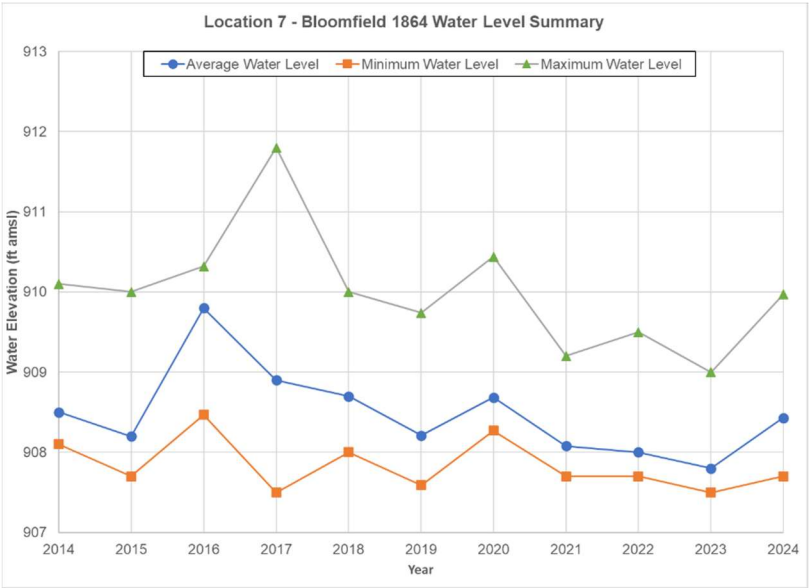
Loc #8	600	929.7	935.04	RCP-E	929.46	10/15/24	931.23	8/29/24
Loc #9	2443	906	926.65	Lift-P	913.08	10/24/24	917.98	8/30/24
Loc #10	614	914	920.22	Lift P	919.40	6/15/24	921.33	9/20/24
Loc #11	1710	918.5	923	RCP-P	912.26	6/12/24	916.40	8/29/24

The water elevation range over the 2024 monitoring period at Location 6 was 2.22 feet and Location 7 was 2.25 feet. There has been no indication of an increasing trend in either average or maximum levels at those locations. Based on the monitoring data collected to date, these basins have been observed to provide adequate storage and infiltration of the runoff that has been conveyed. Location 6 receives discharge from an adjacent splash pad during summer months. On average, 10.7 million gallons per year have been discharged from the splash pad and infiltrated by the basin. The daily level increase and subsequent decrease because of the splash pad discharge in 2024 was approximately 0.19 feet. Long term water trends for Location 7 are shown in **Chart 4.1**.

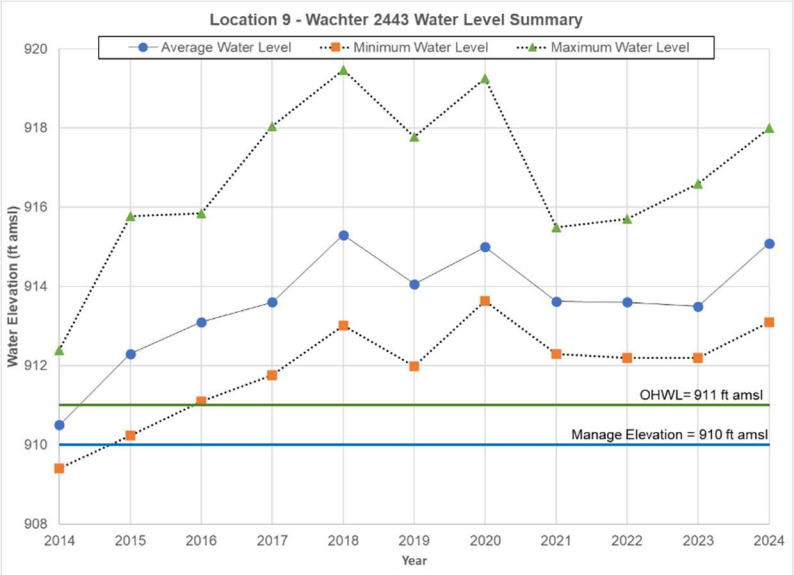
Chart 4.1



Location 9 levels have consistently exceeded its management elevation of 910 feet amsl. The average water level in 2024 was 915.1 feet amsl and was consistent with the average water level for 2020. The average, minimum, and maximum levels in 2024 changed from 2023. In 2024, the average water level

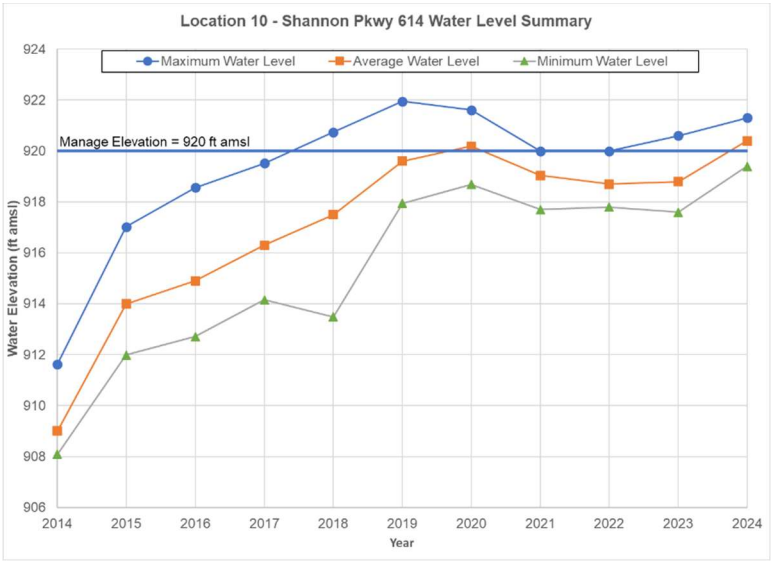
increased from 913.5 in 2023 to 915.1 in 2024. This increase is also represented in the maximum and minimum water levels for the pond compared to 2023. The water level in pond 9 is the highest since 2018 when the average water level reached 915.3 ft. Long-term trends for Location 9 are presented in **Chart 4.2**.

Chart 4.2



Location 10 has shown an increasing trend in the minimum, maximum, and average water levels since 2014, although 2021 through 2023 had a decrease in levels from previous years. This decrease could be due to lower-than-average precipitation for the last three monitoring seasons. The average, minimum, and maximum levels for 2024 increased from 2023. Location 10 long-term trends are presented on **Chart 4.3** below.

Chart 4.3



The average, minimum, and maximum water level at Location 10 increased in 2024. Location 9 reached the required level of 916 ft for 504 total hours. The level at Location 10 was above the 920-management required level for a total of 2,931 hours. These sites have consistently been above management levels

and should be evaluated for alternative management strategies that aim to restore the capacity of the basin.

4.2. Rainfall to Runoff Calculations

R/R ratios, also known as runoff coefficients, were calculated for each basin in 2024 and the results are presented in tables and charts in **Attachment B**. During the 2018 Surface Water Management Plan (SWMP) update, the drainage areas for the basins were reevaluated. As a result, the R/R ratios were recalculated for the previous years (2014-2017), with the updated drainage information. The annual R/R ratios provided below are based off the linear regression of individual R/R events (**Chart 3.4**). The long-term average R/R ratios are presented on **Table 4.2**, below.

Table 4.2: R/R Ratio Summary

Pond Information		Percent (%) Impervious	Long Term Average R/R Ratio	2014 R/R Ratio	2015 R/R Ratio	2016 R/R Ratio	2017 R/R Ratio	2018 R/R Ratio	2019 R/R Ratio	2020 R/R Ratio	2021 R/R Ratio	2022 R/R Ratio	2023 R/R Ratio	2024 R/R Ratio

City-Wide Average		**34%**	**0.21**	**0.21**	**0.22**	**0.23**	**0.25**	**0.20**	**0.21**	**0.19**	**0.19**	**0.21**	**0.20**	**0.19**
Greatest R/R Ratio														
Least R/R Ratio														

A larger R/R ratio is indicative of less storage and infiltration within a drainage area, and consequently, a greater proportion of runoff being produced. Drainage areas that have a larger percentage of impervious surface will typically exhibit a higher R/R ratio. Event-based R/R ratios can vary greatly depending on rainfall intensity and the antecedent soil moisture.

The City-wide R/R ratio has not varied much over the years ranging from 0.19 in 2024 to 0.25 in 2017, with the long-term average being 0.21. Of the monitored basins, Location 3 has consistently exhibited one of the greatest R/R ratios since 2014, which has shown that on average, 41 percent of the rainfall within that drainage area ends up as runoff. The Location 3 drainage area consists of 37 percent impervious

surface which is slightly above the average of the monitored basins (34 percent). The predominate land use at Location 3 is low density residential (98 percent), with the remaining area designated as open park space.

Other basins that have shown higher R/R ratios include Location 1 and Location 8 having a long-term R/R ratio of 0.41 and 0.32, respectively. The drainage area for Location 1 consists of 17 percent impervious surfaces, which is the lowest percentage of the monitored basins. The higher R/R can be attributed to variability in upstream runoff contributions from basins that discharge to Location 1 that are not within the immediate drainage area. Location 8 consists of 43 percent impervious surfaces, includes drainage from a significant portion of commercial land use along 150th St. SW (CSAH 42). Location 8 had the second highest R/R ratio in 2024.

Location 2 (1486) has produced the lowest R/R ratio almost every year monitored with a long-term average of 0.08. The Location 2 drainage area is 25 percent impervious, which is the 2nd lowest of the basins monitored. The predominate land uses include Transitional Residential (67 percent) and Rural Residential (31 percent). The long-term rainfall to runoff ratios can be seen in **Chart 4.4** below.

Greatest Rate

Lowest Rate

The water level data was utilized to generate an infiltration and evaporation rate for the basins when water levels were below outlet and pump elevations. The 2024 infiltration rates are presented in the tables included as **Attachment B**. A long-term summary of the average infiltration rates is provided in **Table 4.4** below. The infiltration rates were evaluated against the estimated rates identified in the City's Non-Degradation Report that was completed in 2007. The rates described below are inclusive of both infiltration and evaporation.

Table 4.4: Infiltration Rate Summary

Infiltration monitoring has shown a long-term average infiltration rate of 0.060 in/hr. City-wide. Annually, infiltration rates have ranged from 0.200 in 2024 to 0.007 in 2022. The City's Non-Degradation Report utilized an average infiltration rate of 0.030 in/hr. This was developed by taking the average infiltration rates that were identified for type D soils during a literature review. As shown above, the City-wide average infiltration rate has exceeded the City's Non-Degradation Report rate every year that monitoring has been conducted.

In 2024, Location 11 (1720) had the greatest infiltration rate at 0.200 in/hr. The greatest long term average infiltration rate of 0.127 in/hr occurred at Location 3. Location 8 had the lowest infiltration rate in 2024 and continues to have the lowest long term average infiltration rate at 0.020 in/hr.

At Location 8, accumulation of sediment and vegetation growth near the pond outlet has increased the elevation needed for the pond to discharge from an elevation of 929.70' to 930.05'.

4.4. Water Quality Results

The water quality data collected to-date is provided for each monitoring location in the Tables and Charts included as **Attachment C**. Water quality sampling has consisted of growing season sampling, roughly April – October. Appropriate data collected has been added to the long-term calculations. The long-term median growing season concentration (excluding snow melt samples) for each of the evaluated parameters is presented in **Table 4.5** and the 2024 growing season average concentrations in **Table 4.6** below.

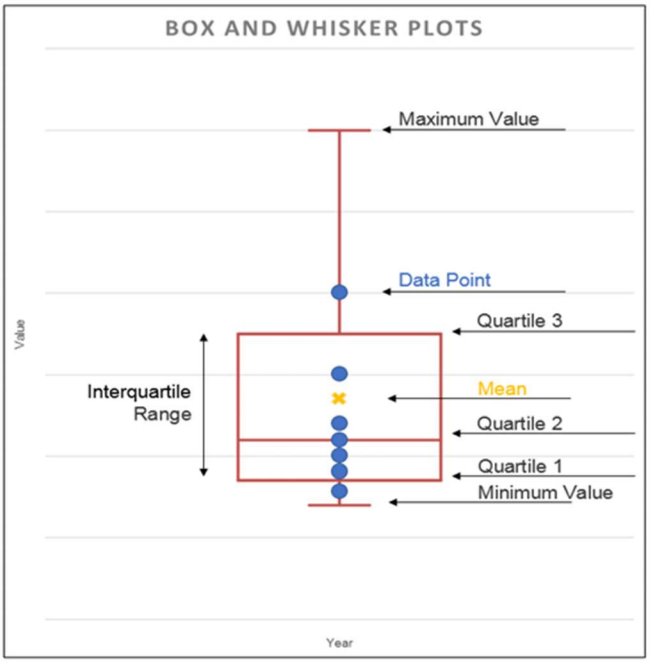
The findings of the water quality sampling are summarized within this section by pollutants. The results are presented in box and whisker plots which provide a visual representation of the sample distribution and show important statistical data. A summary of the metrics presented on the box and whisker plots is shown on **Image 4.2**. Individual data points that lie outside of the minimum and maximum values are outliers.

Image 4.2 – Box and Whisker Plot Legend



Median – the value separating higher and lower half of data, also known as the "middle" value

Mean – the sum of the values divided by the number of values

Interquartile Range (IQR) – represents the distance taken up by the middle 50% of the data set. This is helpful because the outlier data points are cut out of the data set

IQR = Q3 – Q1 (75^{th} Percentile – 25^{th} Percentile)

If IQR small, data are mostly close to the median

If IQR large, data is more spread out from median

Quartile 1 (Q1) or 25^{th} Percentile - the middle value in the first half of the data ordered data set

Quartile 2 (Q2) – the median value

Quartile 3 (Q3) or 75^{th} Percentile – the middle value in the second half the ranked order data set

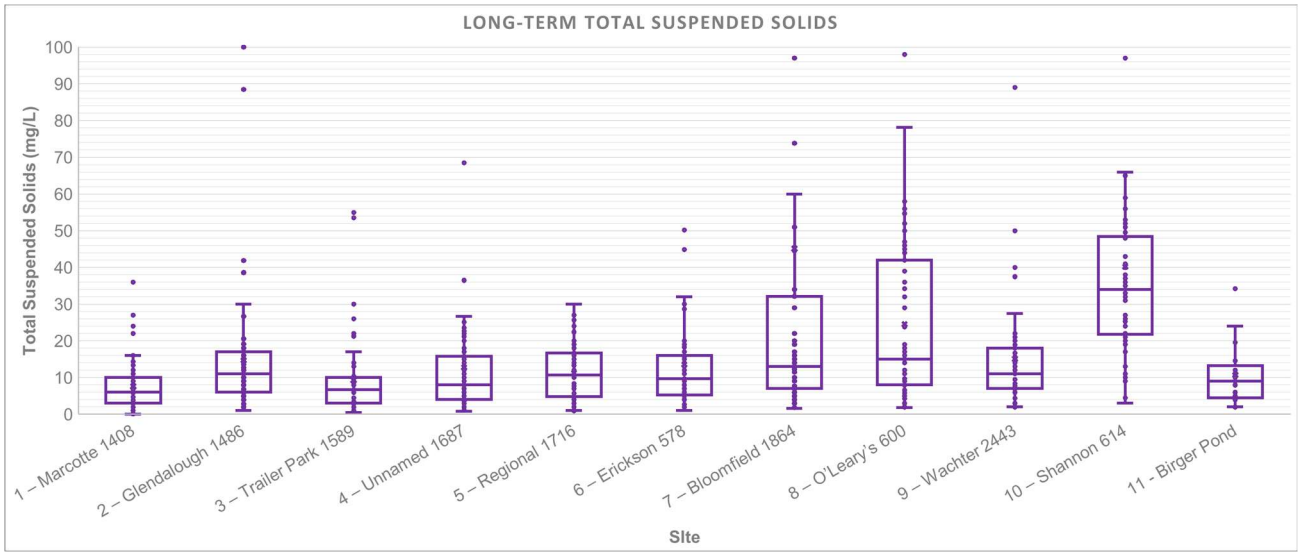
Total Suspended Solids

Sources of TSS in stormwater include deteriorated pavement, vehicle exhaust emissions, vehicle parts, building and construction material, road salt, road paint and pedestrian debris, soil material, plant and leaf litter, and atmospheric deposition of particles. Suspended solids transported into rivers and lakes eventually settle on the bottom, and over time this accumulated sediment can clog and alter the topography of bodies of water.

City-wide, the TSS long term median is 12 mg/L, which is unchanged from the previous year's long-term median. Median TSS values range from 6 mg/L at Location 1 to 34 mg/L at Location 10. The greatest variability in TSS concentrations have been seen at Location 7, Location 8 and Location 10, as demonstrated by larger inter quartile ranges (IQR), depicted as the "box" on **Chart 4.5** below. The IQR reflects the middle 50 percent of the data collected at that site. Location 1 (6 mg/L) and Location 3 (7 mg/L) have the lowest long-term median TSS and are comprised of predominately low density residential and commercial land uses. Location 10, with the greatest long-term median TSS concentration, consists of predominantly low-density residential land use.

The City's Non-Degradation Study presented an estimated event mean concentrations for TSS based on land uses, which were derived from a review of applicable research documents. These concentrations included 50 mg/L for open space, 140 mg/L for single family residential, and 215 mg/L for agricultural land uses. Basins built to NURP design standards are anticipated to provide TSS treatment efficiencies of 85 percent. The City-wide TSS median of 12 mg/L shows that overall, the monitored basins have provided effective TSS treatment.

Chart 4.5 – Total Suspended Solids



2024 Total Suspended Solids

In 2024, the City-wide TSS average concentration was 21 mg/L and had a range from 7 mg/L at Location 1 to 39 mg/L at Location 8. 2024 TSS values were higher than 2023 which had a city wide average TSS concentration of 12 mg/L.

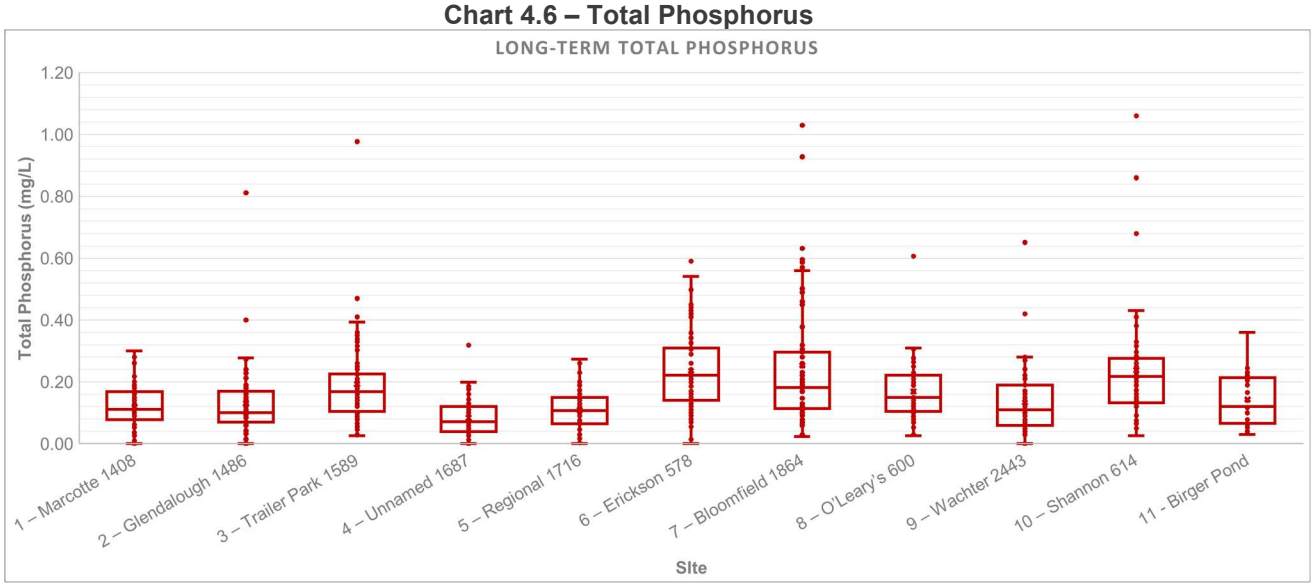
Total Phosphorus

Sources of phosphorus in urban runoff include plant and leaf litter, soil particles, pet waste, road salt, fertilizer, and atmospheric deposition of particles. Lawns and roads account for the greatest loading, which has shown to contribute about 80 percent of total and dissolved phosphorus (Waschbusch et. al 1999). Phosphorus has a direct effect on plants and algal growth in lakes and is one of the leading causes of deteriorating lake water quality.

City-wide, the average TP long term median is 0.14 mg/L, ranging from 0.07 mg/L at Location 4 (1687) to 0.22 mg/L at Location 10 and Location 6. Additionally, Location 5 and 4 have the smallest IQR, which indicates that the sample concentrations were closer to the median, with less overall variability. The greatest variability in TP concentrations was seen at Location 7. **Chart 4.6** shows the long-term TP averages and variability.

Typical concentrations of TP for untreated stormwater are 0.22 mg/L for commercial purposes, 0.30 mg/L for residential, and 0.32 for cropland land uses. Basins built to NURP design standards are anticipated to provide TP treatment efficiencies of approximately 60 percent. The City-wide average median of 0.14 mg/L TP is within the anticipated range for treated stormwater (<0.20 mg/L).

Chart 4.6 – Total Phosphorus



2024 Total Phosphorous

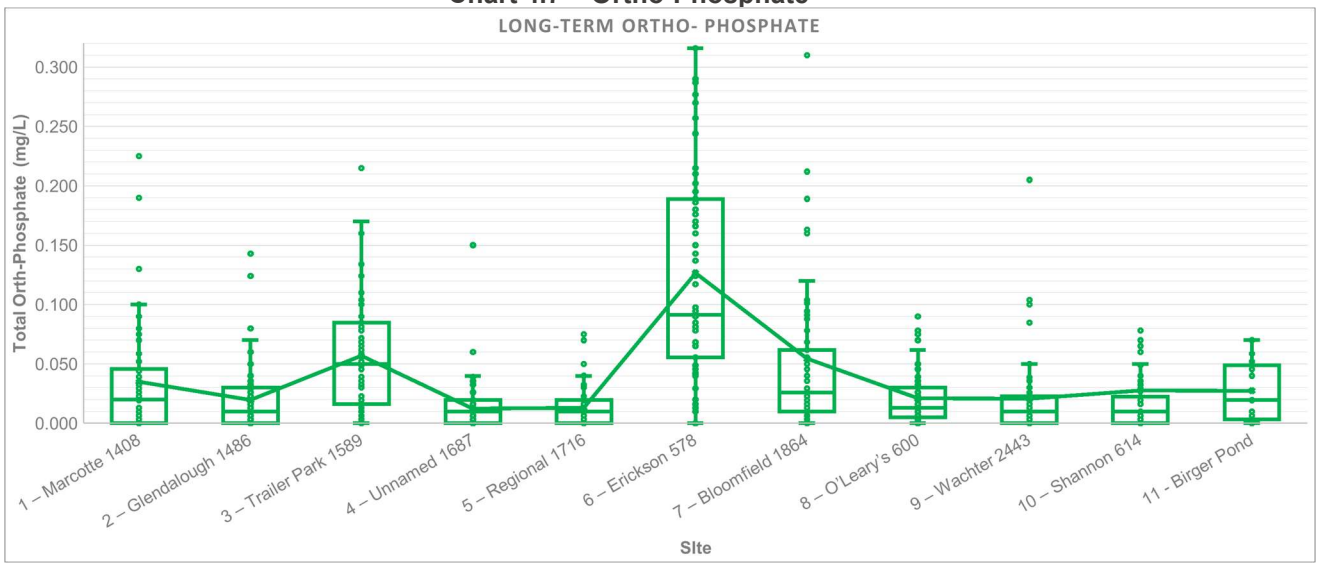
During the 2024 growing season, the City-wide TP average concentration was 0.13 mg/L, which is down from 0.15 mg/L in 2023. Location 6 and 8 had the highest average concentrations of TP at 0.20 mg/L and location 4 had the lowest concentration of TP at 0.07 mg/L.

Ortho-Phosphate

Orthophosphate is the dissolved component of total phosphorus that is readily available for algal production. Dissolved phosphorus typically accounts for about 45 percent of total phosphorus but can exceed 50 percent when the source is plant litter and lawns, and as low as 25 percent when the source is predominantly sediment (Waschbusch et. al, 1999).

City-wide, the OP long term average median is 0.024 mg/L, ranging from 0.010 mg/L at Location 2, Location 4, Location 5, Location 9, and Location 10 to 0.091 mg/L at Location 6. Location 6, with the greatest observed OP, receives water from a splash pad and contains open park space within a significant portion of its drainage area. For all monitoring locations OP on average, has been 18 percent of the TP that was observed which is much lower than the expected range when source is plant litter and lawns. **Chart 4.7** shows the long-term OP averages and variability.

Chart 4.7 – Ortho-Phosphate



2024 Ortho-Phosphate

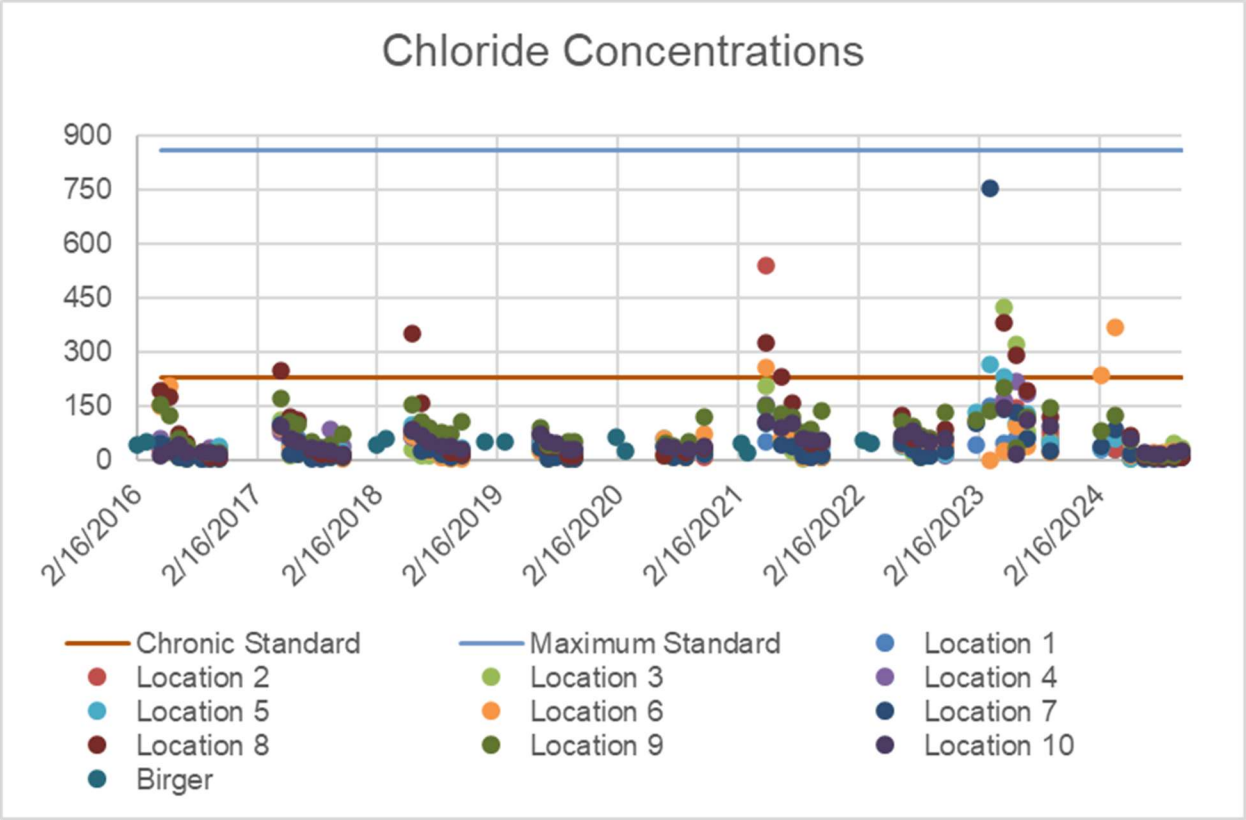
During the growing season of 2024, the City-wide OP average concentration was 0.024 mg/L, which is equal to the long-term average. Many locations saw lower values in OP 2024 compared to 2023. Location 1 was the only location that had a higher concentration of OP at 0.036 mg/L in 2024 compared to 0.013mg/L in 2023.

Chloride

Chloride is a key component of road salt, which is soluble and highly mobile in water. When snow and ice melt, the salt that has been applied to icy roads, parking lots, and sidewalks is conveyed with it into surface water and groundwater. Elevated chloride levels can affect our drinking water supplies and can be toxic to aquatic organisms. The chloride water quality standard for 2B lakes is a 4-day average of 230 mg/L for chronic toxicity and 860 mg/L as the maximum standard toxicity. These standards are used for Public Waters which include Location 9 and Birger. The other monitoring locations are only provided for comparative purposes.

Chloride sampling was implemented City-wide in 2016, with snowmelt sampling being conducted at select basins in 2016 and then again from 2018 through 2024. The chloride results are plotted on **Chart 4.8** below. Additionally, chloride charts for the individual basins are included as **Attachment C**.

Chart 4.8 – Chloride Concentrations



Location 6 exhibits significant snowmelt concentrations for chlorides, but those concentrations readily decreased over the summer months. Location 6 drainage area contains parking lots and pathways that may contribute to its higher concentration levels during winter/spring. This was the case in 2024, Location 6 snowmelt samples were above the chronic standard, but decreased over the summer months. Location 6 was the only pond do exceed the chronic standard in 2024. Location 8 has shown snowmelt and spring routine samples that have exceeded the chronic standard but were below the chronic standard throughout the entirety of the monitoring season.

In addition to elevated snowmelt chloride levels, Location 9 has the greatest growing season chloride concentrations of all the basins. One notable observation is that Location 9 chloride levels decreased throughout the growing season, which hasn't been case in previous years. The increase in these concentrations in the fall could indicate that the basin is stratified over the summer.

Locations 6, 8, and 9 all contain areas of commercial and/or downtown land use within their drainage areas, which are typically associated with higher salt use in the winter. This is reflected in the elevated chloride concentrations observed within the basins. Location 6 and Location 9 are both landlocked, which results in pollutants being concentrated within those basins and not discharged downstream.

The remaining monitoring locations have not had an exceedance of chloride water quality standards during routine sampling and have not shown any notable increasing trends with respect to chloride levels.

2024 Chloride

During 2024, the City-wide growing season chloride average concentration was 29.9 mg/L, which is less than the long-term average of 56.1 mg/L. Location 6 had the highest average chloride concentration at 99.6 mg/L. Location 1 had an average of 46.3 mg/L. Most locations saw consistent chloride levels throughout the year.

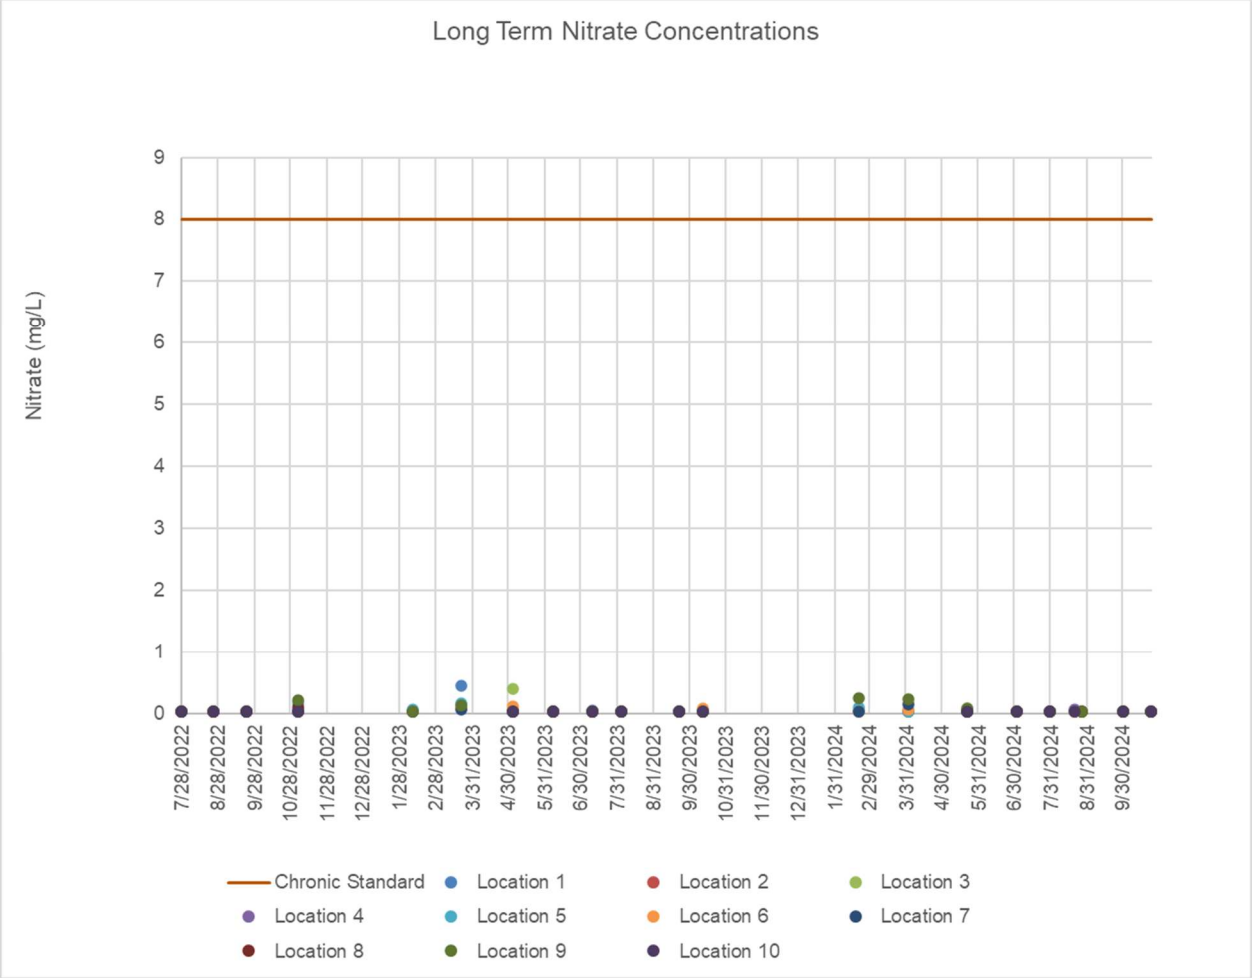
Nitrate

Nitrogen is a nutrient that is necessary for plant and algae growth. Most nitrate (a form of nitrogen) in Minnesota waters comes from agriculture practices while only one percent is estimated to come from urban stormwater (MPCA 2013). At increased levels, nitrates can be detrimental to aquatic life, cause algal blooms, and possibly dangerous to human health. In 2022, the MPCA proposed nitrate criteria to protect aquatic life. The proposed chronic 4-day standard for Class 2B lakes is 8 mg/L. Nitrate monitoring was new to the City's monitoring program in 2022.

2024 Nitrate

During the 2024 growing season, the City-wide nitrate average concentration was 0.036 mg/L. Location 9 had the highest average level of nitrate at 0.092 mg/L, which is far below the proposed standard of 8 mg/L. Long term nitrate sampling results are plotted on **Chart 4.9** below.

Chart 4.9 – 2024 Nitrate Concentrations



5. CONCLUSIONS AND OBSERVATIONS

Eleven basins were monitored for water level and water quality to provide the City with empirical data that can be used to help guide stormwater management activities. A summary of the notable findings from the monitoring activities are provided below:

Water Level Monitoring

- Landlocked basins Location 9 and Location 10 have shown a significant increasing trend in minimum, maximum, and average water levels over the long-term monitoring period, but saw lower levels in 2021 through 2023 due to low precipitation totals (drought conditions). Despite drought in September and October 2024, minimum, maximum and average water levels increased from 2023.
- Even with four years of drought, the average water level at Locations 7, 9 and 10 has remained stable and not dropped significantly since 2021. Management activities at those sites should be evaluated to ensure adequate storage capacity and acceptable water levels at those sites.
- The long-term City-wide R/R ratio was 0.21. This remains consistent from the previous year.
- Long term R/R ratios varied by site from 0.40 at Location 1 to 0.05 at Location 2. Those sites consisted of 37 percent and 25 percent impervious surfaces, respectively.
- Infiltration monitoring has shown a long-term average infiltration rate of 0.063 in/hr City-wide. Since 2015, infiltration rates have consistently decreased, until 2023 (0.066 in/hr) and 2024 (0.095 in/hr).

Water Quality Monitoring

In general, higher stormwater pollutant levels were observed at Location 6, Location 9, and Location 10. This is largely due to these basins being landlocked and pollutants staying concentrated within the basin and are not transported downstream.

TSS:

The long-term average median concentration for TSS City-wide was 12 mg/L. The long-term median TSS concentration ranged from 6 mg/L at Location 1 to 34 mg/L at Location 10.

TP:

The long-term average median concentration for TP City wide was 0.14 mg/L which is slightly below the anticipated range for treated stormwater of 0.15 to 0.20 mg/L. The long-term median TP concentration ranged from 0.07 mg/L at Location 4 to 0.22 mg/L at Location 6 and 10.

OP:

The long-term OP was noticeably greater at Location 6 than the other monitored basins. In 2024, Location 6 has the highest long-term median of OP, 0.091 mg/L.

Chloride:

- Locations 6 and 9 contain areas of commercial and/or downtown land use within their drainage areas, which is typically associated with higher salt use in the winter. Location 6 tends to see high levels during winter sampling, while Location 9 has the highest long term median chloride levels at 77.2 mg/L. Location 9 is a landlocked basin that may be contributing to the elevated chloride levels throughout the monitoring season.
- There has been an increasing trend in chloride concentrations since monitoring began in 2014

Nitrate:

- Nitrate monitoring was new in 2022. The MPCA proposed chronic nitrate concentrations for Class 2B waters are 8 mg/L.
- Nitrate levels were very low throughout the year, with the last sampling of the year having the highest levels overall. The highest nitrate concentration was 0.034 mg/L at Location 3.

1 - Water quality analysis was performed by William Lloyd / Tri-City Laboratory

Indicates sample result below lab detection limits, 1/2 MDL value reported

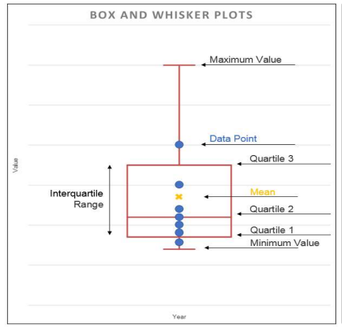
Location 1 - Marcotte 1408
Water Quality Sampling Results

Annual summary concentrations of Total Phosphorus, Ortho-Phosphate, Total Suspended Solids, and Chloride

2024 Water Quality and Quantity Monitoring Study
City of Rosemount, MN

WSB Project No. 025921



Median – the value separating higher and lower half of data, also known as the "middle" value

Mean – the sum of the values divided by the number of values

Interquartile Range (IQR) – represents the distance taken up by the middle 50% of the data set. This is helpful because the outlier data points are cut out of the data set

IQR = Q3 – Q1 (75^{th} Percentile – 25^{th} Percentile)

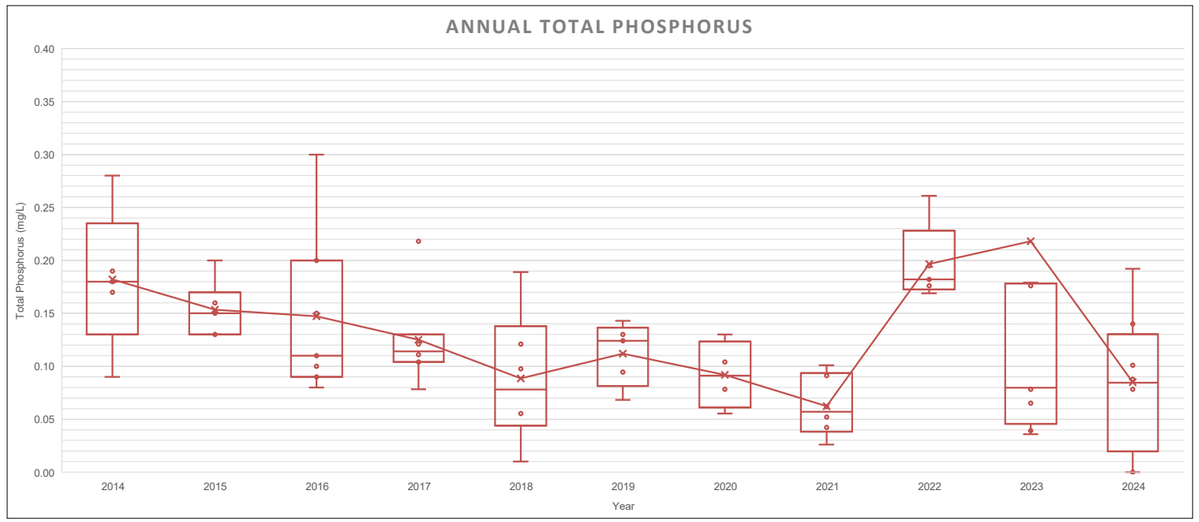
If IQR small, data are mostly close to the median

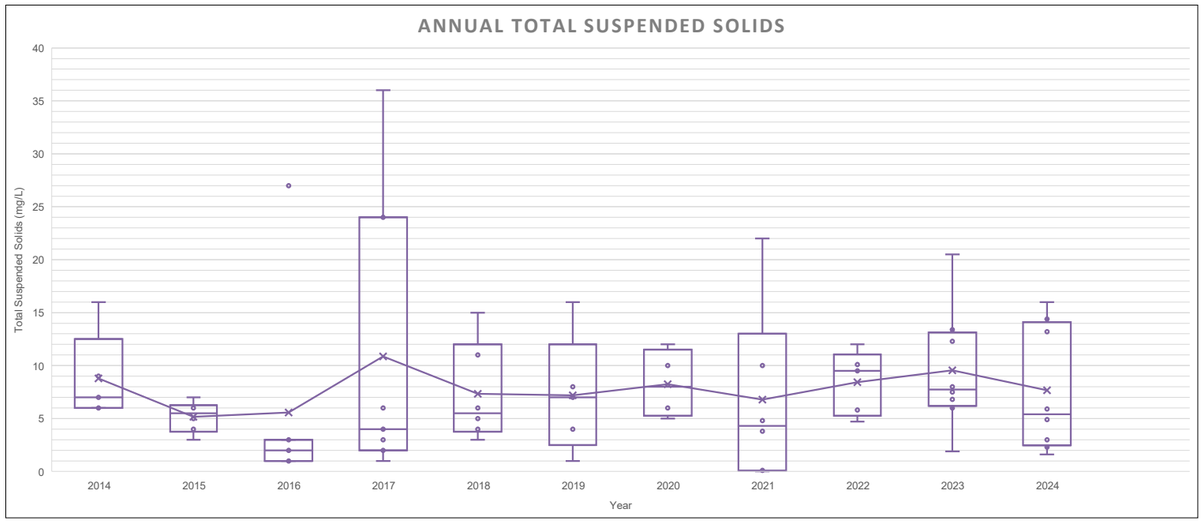
If IQR large, data is more spread out from median

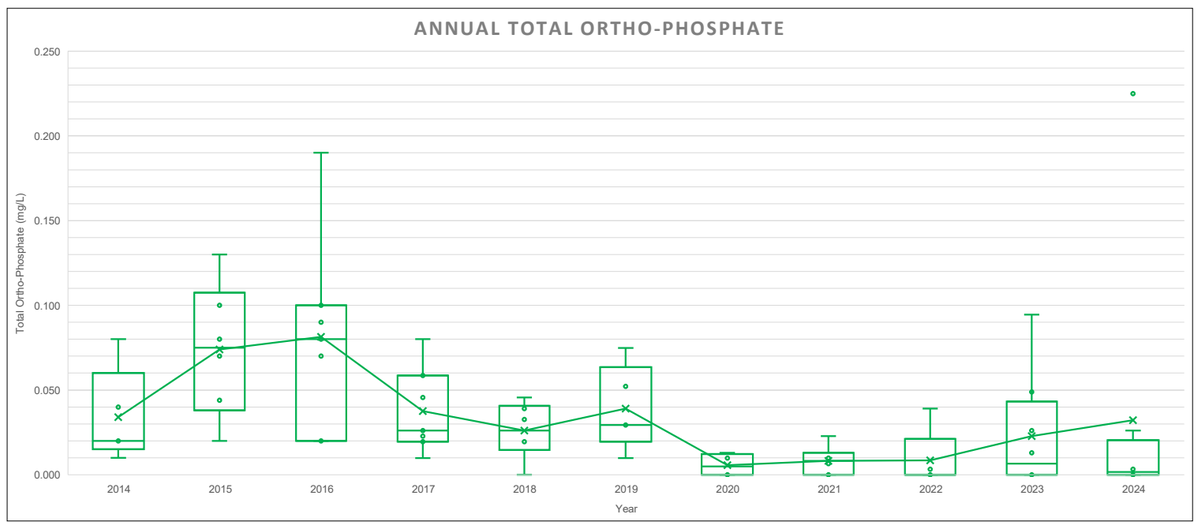
Quartile 1 (Q1) or 25^{th} Percentile - the middle value in the first half of the data ordered data set

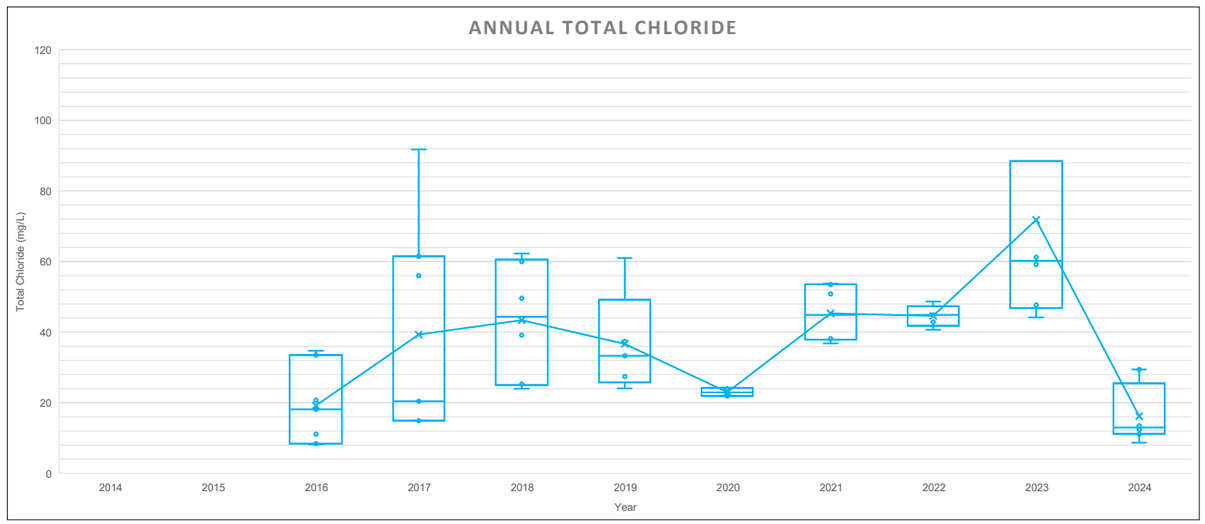
Quartile 2 (Q2) – the median value

Quartile 3 (Q3) or 75^{th} Percentile – the middle value in the second half the ranked order data set









Location 2 – Glendalough 1486
Water Quality Sampling Results

Annual summary concentrations of Total Phosphorus, Ortho-Phosphate, Total Suspended Solids, and Chloride

2024 Water Quality and Quantity Monitoring Study
City of Rosemount, MN

WSB Project No. 025921
